Title: The universality theorem for Hecke L-functions

Speaker: Yoonbok Lee (KIAS, Korea)

Abstract
Since Voronin proved the Universality theorem for the Riemann zeta function, it was generalized to various $L$-functions. For example, the universality theorem for the Hecke $L$-functions attached to the ray class characters was proved on the strip $\max\{1/2, 1 - 1/d\} < \Re s < 1$ for $d = [K : Q]$. In this paper, we enlarge it to the maximal strip $\frac{1}{2} < \Re s < 1$ under the assumption about the number of zeros inside the strip. As a consequence, we prove the Universality theorem for Dedekind zeta functions for $K/Q$ finite abelian, unconditionally.
